How To Erase Cellulite - Why You Need To Use Cellulite Removal Gels

Cellulite is a skin condition that affects up to 90 percent of the female population in the world who are past puberty. A problem of this size has led to the development of an entire industry that is dedicated to helping individuals to manage and get rid of their cellulite troubles. Among the more popular products for eliminating and improving the appearance of cellulite on the body are many varieties of anti cellulite gels, anti-cellulite creams and lotions which might be massaged topically over the skin on problem areas. Anti cellulite gel might help to reduce the orange peel, dimpled effect that cellulite causes on the skin's surface.

You have several different types of materials that are utilized in topical anti cellulite remedies, with the three main ones being lotions, anti-cellulite creams and anti-cellulite gels. They very often have the same kind of ingredients in them and so it is up to you which kind of topical agent you opt to use. Most women have a preference for anti cellulite gel because it massages into the skin layers without difficulty and it does not have a greasy or oily texture. These anti-cellulite skin products will only have short-term effects however it can be very helpful to enhance the appearance of your skin when attending a social event or beach party.

The anti cellulite gels that are on the market work in several different ways. Some of them employ ingredients that when absorbed into the subcutaneous layers of your skin act to break down any accumulated fats, allowing them to be flushed away by the body. Other types of gels include ingredients such as the naturally produced body protein collagen, in order to help fill in and smooth out the cottage cheese look which is characteristic of cellulite. While choosing an anti-cellulite product make sure that it include substances that are capable of improving blood flow, reducing inflammations and act as antioxidants for example Retinol, aminophylline and caffeine.

When a caffeine based skin cream or gel is applied topically it can increase the circulation of blood in the skin and this aids flushing out unwanted toxic impurities that induce cellulite to form and also help to burn off the surplus fats. Alpha hydroxy acids like lactic acid and glycolic acid could improve cellulite appearance by working as an exfoliating agent and getting rid of detritus and dead skin cells from cellulite prone areas. Some forms of herbal acids derived from plants like citric, tartaric and phytic acids can also be of help in enhancing both the tone and the texture of the skin layers and consequently lessening the orange peel look of cellulite.

Retinol and other retinoids are derivatives of the powerful skin protector vitamin A. Retinol is utilized to increase the skin's thickness and to assist in improving circulation under the skin. Derivatives of vitamin A could leave the skin prone to damage from the sun, therefore gels containing them are better applied at night. Aminophylline is used in anti cellulite gels so as to help break down the surplus fats that are one of the major causes of the cellulite skin problem. This substance also aids to lessen the orange peel effect of cellulite. Anti cellulite gels containing these substances should help reduce cellulite problems.
